ALLISON IRON HORSE

'SUPER SKID'

PAYMENT REQUIREMENTS:
WIRE TRANSFER OR CERTIFIED FUNDS
NO CREDIT CARDS OR COMPANY CHECKS

Our Super Skid Configuration
has been the industry's
#1 SELLING
Contractor Grade Pressure Washer
for the last 15 years.

SUPER SKID SUPER SALE!
Just in time for
COLD WEATHER!

SYSTEMS INCLUDE:

- Featuring the New 2012 KOHLER & Vanguard Engines
- General TS-2021 & TSF pumps with ceramic coated pistons
- Safety pressure relief system that by-passes over pressurized water
- Premium flow or pressure switch that controls burner firing sequence
- Premium 12-Volt Beckett Burner equipped with precise fuel delivery system
- Schedule 80 vertical coil system
- Marine grade battery compartment for added protection & battery life
- Oversized fuel & gas tanks
- Injector, Hose, Gun & Lance sold separately

TECH-TALK: ENGINES

FORMULAS FOR DETERMINING THE BEST HORSEPOWER:

Pressure washers are generally powered by gasoline engines, diesel engines, propane fired engines, or electric motors. Force created by the power plant turns the pressure pump, which in turn moves the water. A power plant must have enough force to continue to turn the pump crankshaft when the pump is pushing water out its rated flow and pressure. The following formulas are used to determine how much power is required to drive a specific pump.

The power is measured in horsepower.

$GPM \times PSI$ then divide by 1100 Equals Gas HP

$GPM \times PSI$ then divide by 1260 Equals Diesel HP

CAUTION

When using a gear drive pump you have to remember to adjust your horsepower requirements.

For example; let's say that you want to produce 10.0 GPM @ 3,200 PSI. Using the formula above you would assume that 10.0×3200 divided by 1100 would be adequate. After all the math says all you will need for this specification is 29 horsepower and since you have a 30 horsepower engine you should be all set? Right? Wrong!

When you use a gear drive your maximum engine speed should be no more than 3200 RPM. Since engine horsepower on gas engines is always rated at 3600 RPM you can see that by reducing the speed so do you reduce the horsepower.

30 horsepower divided by $3600 \text{ RPM} \times 3200 \text{ RPM}$ will mean that at the adjusted engine speed your 30 horsepower engine will only be producing approximately 26.66 horsepower at 3200 RPM.
