

- Nozzles (high pressure, rotary, thruster, low pressure)
- Nozzle Holder (twist, shower, ball type, or trombone)
- Lances (different lengths, they break)
- Trigger Gun (This is a wear item)
- Short jumper hose (gun to long hose)
- Couplers and plugs (Always have these new and ready in your inventory)
- Hose (If one blows, clip on the next)
- Chemical injector, tubing, and filters (no chemical? Without spares you go home)

Hey, look at that, we have made it to the pressure washer. If you are a small operation and think any of the above spare parts aren't necessary, I hope you are very lucky, or want to stay small time. Let's keep working back upstream.

- Jumper hoses (replacements for any on your machine)
- Pipe fittings (to replace what you have on your equipment)
- Hot water coil (now that's a big item, you may have to work cold for a while, bypass it while you wait)
- Burner parts, Igniter, Fuel nozzle, Fuel pump. Fuel filter, French fries (sorry, checking to make sure you are paying attention, they wouldn't stay hot anyway), flow or pressure switch, thermostat, hi-limit switch
- Unloader (a must have spare, at least one)
- Gauge (or at least a plug for when it leaks)
- Pump or parts (short of having a new one on the shelf, check valves aren't a bad idea)
- Got Belts?
- Inlet water filter (because things happen)
- Fill hose (for when something destroys it)
- Chemical (you wouldn't run out of detergent, would you?)
- Drum pump (if you depend on it)

There you go. Now you won't have to call up to be rescued. Eat a good breakfast, work and play hard. It's advice to live by. Talk to you next month.
