

Glass De-Etch

And Yes, it Really Works!

Glass De-Etch is a polishing compound used for removing acid stains or etching on glass. It contains extremely fine rare earth particles that remove etching, light scratches, hard water spots and alkaline stains. This product can also be used to remove acid streaks from chrome.

-Jewelers use a lesser grade of this compound to polish out scratches on expensive crystal such as those found on expensive watches.

-Rare Earth Glass/Crystal Polishing Compound to be Used when severe ACID damage has occurred.

-This Product Should Be In EVERY Mobile Washers Toolbox

-A high stock removal rate, which is partially due to the narrow particle distribution resulting in a low percentage of fines, leaves a clear, bright finish.

Physical Characteristics:

Color: Pale Pink

Composition: REO Content - 76%

Avg Particle Size: 3.4 Microns

1 Lb Container

Enough for 10-15 Windshields
